

Abstract:

The current research aims to identify "The effect of the strategy of (PDEODE) in the Interest towards chemistry subject for students of the second intermediate class". The researchers has selected an experimental design with a Partial control they chose by chance the (Almarkizaa Secondary School) for male students, by the same way he chose section (A) to represent the experimental group of (36) students and section (B) to represent the adjusting group of (36) students. The researchers has designed the behavioral aims for the paper subjects, topics lessons plans and A measure of interest towards chemistry material , and these have been shown to a group of experts validity and reliability were verified. The final test applied and after processing data statistically the following results occurred there is a difference and for the benefit of the experimental group. In the light of the result, certain conclusions, recommendations and suggestions were proposed.
